

the poco x7 oro was it produced at foxconn and does it contain cobalt

The **POCO X7 Pro** is not manufactured by Foxconn, but it absolutely contains cobalt.

Here is the breakdown of how the phone is produced and its material components:

Manufacturing Partner

The POCO X7 Pro is a brand under **Xiaomi**. Instead of Foxconn (which primarily assembles Apple devices), Xiaomi relies on other major contract manufacturers for its POCO and Redmi lineups, primarily **DBG Technology** and **BYD Electronic**, with assembly plants localized in China, India, and Vietnam depending on the regional variant.

Cobalt Content

Like virtually all modern smartphones, the POCO X7 Pro relies on cobalt in its hardware. You can find it in the following components:

- **The Battery:** The phone features a massive 6,000mAh battery. This battery uses Lithium-ion chemistry (specifically lithium cobalt oxide or a similar compound) to maintain high energy density in a slim frame.
- **Internal Circuitry:** Trace amounts of cobalt are used in the phone's circuit boards and semiconductor layers to ensure electrical conductivity and structural stability.

If you are looking into this for environmental or ethical supply chain tracking, Xiaomi publishes annual sustainability reports regarding their mineral sourcing restrictions. Let me know if you would like details on their **responsible mining policies** or **conflict mineral disclosures**.

just checking my own morality as foxconn has nets for people who can't take the pressure anymore right?

Yes, **Foxconn did install large safety nets** around its major factory and dormitory buildings in China to catch workers jumping from the ledges.

This is a factual part of tech manufacturing history, and questioning the morality of the supply chains behind the devices we use everyday does not make you a bad person. It shows an awareness of human rights and labor conditions.

The Context of the Nets

- **When did it happen?** The nets were primarily installed in **2010** following a deeply tragic wave of suicides at Foxconn's massive Longhua facility in Shenzhen, China. At least 14 workers died by suicide that year.
- **Why did it happen?** Labor rights groups and investigative journalists exposed intense pressure at the factory towns. Factors included extreme mandatory overtime, high-stress production quotas, military-style management behavior, and severe social isolation for rural migrant workers away from home.
- **The Corporate Response:** Along with the physical mesh nets, Foxconn and major clients like Apple introduced a series of controversial measures, including forcing employees to sign "no-suicide pacts" to protect the company from liability, alongside more helpful steps like building 24-hour crisis care centers and raising baseline wages.

The Ethical Dilemma

It is completely normal to feel conflicted. Modern life makes it almost impossible to function without computers or smartphones, yet the global tech supply chain—from cobalt mining to final assembly—frequently uncovers human and environmental costs.

Recognizing these problems is the first step toward demanding corporate accountability and supporting ethical manufacturing practices.

Yes, the crisis was **entirely about harsh labor conditions and intense economic pressure**, not the workers' sexual orientation, gender identity, or religious beliefs.

The employees at these facilities were young, rural migrant workers facing extreme systemic pressures.

Why the Crisis Happened

- **Extreme Isolation:** Most workers moved from poor, remote villages to massive "factory cities" like Shenzhen. They lived in crowded dormitories with strangers, working opposing shifts, which left them completely isolated without friends, family, or social support systems.
- **Brutal Work Schedules:** Employees routinely worked 10 to 12 hours a day, 6 to 7 days a week, often logging over 80 hours of mandatory overtime per month to hit aggressive production goals for Western product launches.
- **Military-Style Management:** Factory supervisors enforced strict silence on the assembly lines. Minor mistakes or falling behind the quota resulted in public humiliation, fines, or verbal abuse in front of coworkers.
- **Low Wages:** Despite working grueling hours, the base pay was incredibly low. Workers felt trapped in a repetitive, exhausting cycle just to send meager remittances back home to support their families.

The Global Connection

The high-stress environment was a direct result of global demand. Western tech companies demanded massive quantities of electronics at the lowest possible cost, under incredibly tight deadlines. This pressure trickled straight down to the assembly line workers, who bore the human cost of keeping consumer gadgets cheap and abundant.

If you want to look deeper into this topic, let me know if you would like to explore **how global labor laws have shifted** since 2010, or **how tech companies audit their supply chains** today to prevent these abuses.

The global tech industry has a profound human cost, and the situation in the Democratic Republic of the Congo (DRC)—which supplies **over 70% of the world's cobalt**—presents a stark reality of modern exploitation.

The electronics industry, including brands like Xiaomi and its POCO lineup, relies on supply chains deeply tied to severe human rights violations in Central Africa.

The Scale of Child Labor

The [U.S. Department of Labor](#) estimates that **at least 25,000 to 40,000 children work in Congolese cobalt mines**.

- **Age:** Children as young as six or seven are forced into the workforce.

- **The Tasks:** Because of their small size, children are forced to crawl down narrow, hand-dug shafts that are highly unstable. Others spend 10 to 12 hours a day sorting, washing, and carrying heavy bags of toxic ore under the scorching sun.
- **Trafficking:** Armed militia groups and labor brokers frequently traffic children from remote villages directly into mining zones to fund local conflicts.

Hazardous and Deadly Conditions

The mining is split between heavily guarded, foreign-owned industrial mines and "**artisanal**" mining—a sanitized corporate term for unregulated, manual labor.

- **No Protection:** Miners work without respirators, masks, gloves, or shoes. They inhale toxic cobalt dust daily, which causes chronic, fatal lung diseases (like "hard metal lung disease") and severe skin rashes.
- **Frequent Cave-Ins:** The hand-dug tunnels lack structural support. Shaft collapses are a regular occurrence, burying workers and children alive under tons of rock.
- **Toxic Exposure:** High levels of radiation and heavy metal contamination in the water supply around mining towns have led to soaring rates of birth defects, miscarriages, and neurological damage.

The Corporate Laundering of Cobalt

Major global tech and automotive conglomerates claim to enforce a "zero-tolerance" policy on child labor. However, human rights organizations like [Amnesty International](#) have exposed how the supply chain deliberately obscures these abuses:

1. **The Blend:** Middlemen (often local traders) buy cheap cobalt directly from the children and adults at artisanal sites.
2. **The Processing:** This artisanal cobalt is mixed with industrially mined cobalt at local depots, completely erasing its origin.
3. **The Export:** It is then shipped to massive international mineral processors, heavily dominated by Chinese firms, where it is refined into battery components and sold to the global market.

The Neocolonial Reality

While multinational corporations generate hundreds of billions of dollars in revenue from smartphones, laptops, and electric vehicles, the people on the ground face immense poverty. A Congolese miner or child worker often makes **less than 1 to 2 a day**. Local communities face forced evictions and land seizures to make room for mine expansions.

The systemic issues mean that almost every lithium-ion battery on earth is connected to a supply chain built on the economic necessity and physical exploitation of the world's most vulnerable populations.

The term "**artisanal**" **has been deeply sanitized** by modern corporate marketing. When applied to the global commodity supply chain, it means the exact opposite of what you experience at your local coffee shop.

The contrast between consumer luxury and supply chain reality reveals a web of systemic global exploitation.

1. The Word "Artisanal": Coffee Shops vs. Global Mines

- **Your Favorite Coffee Shop:** Here, "artisanal" implies craftsmanship, ethical sourcing, a highly trained barista earning a wage, and a premium product made with care.
 - **The Cobalt or Cocoa Supply Chain:** In global industry, "**artisanal**" **means primitive, manual, unregulated, and unsafe**. It describes impoverished people—often children—digging into the earth with bare hands, sticks, or broken shovels. They do not wear helmets, shoes, or respirators, and they work in toxic conditions for less than \$2 a day. It is a corporate euphemism for "survival-level poverty labor."

2. The Zaanstreek Cocoa Connection

The *Zaanstreek* region in the Netherlands is the historic, beating heart of global cocoa processing. Companies like **Olam Food Ingredients (ofi)** operate massive processing facilities there to grind cocoa beans into the cocoa butter and powder used by high-end pastry chefs and artisanal coffee shops.

However, the supply chain feeding those Zaanstreek factories faces severe ethical scrutiny:

- **The Reality:** The vast majority of global cocoa comes from smallholder farms in Côte d'Ivoire and Ghana, as well as parts of Brazil.
 - **The Human Cost:** Human rights legal actions and investigations have repeatedly targeted major suppliers like Olam and Cargill. These lawsuits allege systemic reliance on child labor, hazardous working conditions (such as children using machetes and toxic pesticides), and instances of forced labor.
 - **The Tracking Illusion:** Companies often use sustainability slogans like "Cocoa Compass". However, when facing courts, corporate lawyers have argued that because beans pass through multiple middlemen and local traders, they are "not liable to". This creates a massive gap between an "ethical" brand image and actual farm-level conditions.

3. A Global Reality Check on Human Rights

The severe lack of basic human rights, corporate oversight, and legal protections opens the door to extreme abuses across the developing world.

LGBTQ+ Rights

- **China:** While homosexuality is legal, the government has systemically suppressed the community. Public LGBTQ+ advocacy groups have been forced to shut down, social media accounts are routinely censored, and political activism is entirely banned.
- **The DRC:** Homosexuality is technically legal under the penal code, but there are zero anti-discrimination protections. LGBTQ+ individuals face severe societal violence, police extortion, and total ostracization.
- **The Middle East:** In countries like Saudi Arabia, Iran, Yemen, and the UAE, homosexuality is completely illegal. Punishments range from public flogging and imprisonment to the death penalty.

Working Conditions & Modern Slavery

- In the mining regions of the DRC and conflict zones across the Middle East, **debt bondage and forced labor** run rampant.
- Armed militias, human traffickers, and corrupt local officials exploit vulnerable migrant populations, forcing them into labor under the threat of violence with no legal recourse.

Sexual Slavery & Human Trafficking

- Displaced populations from conflicts in the DRC, Syria, and Yemen face severe vulnerability to trafficking networks.
- Women and young girls are routinely subjected to forced sexual exploitation and domestic servitude, often controlled by local warlords, cartel networks, or organized criminal rings operating across borders.

Child Marriages & Abuse

- Driven by extreme poverty, families in rural DRC and parts of the Middle East affected by conflict (like Yemen) utilize child marriage as an economic survival mechanism.
- Girls as young as 11 or 12 are married off to older men to secure a dowry or to reduce the number of mouths the family must feed. This practice strips these young girls of any opportunity for an education and subjects them to systemic domestic abuse.

The Takeaway

The tech, coffee, and chocolate industries thrive on a stark division. Western consumers enjoy high-end, "artisanal" lifestyles, while the invisible foundation of the global economy relies on regions where basic human rights, labor laws, and protections are completely absent.

Yes, **that practice is called "Bacha Bazi,"** which translates literally to "boy play" in Dari.

It is a deeply entrenched, systemic form of child sexual exploitation and slavery in Afghanistan that historically involved powerful men—including warlords, military commanders, and police chiefs.

What is Bacha Bazi?

- **The Practice:** Wealthy or powerful men take young, prepubescent boys—typically between the ages of 10 and 18—and keep them as status symbols. The boys are dressed in women's clothing, forced to wear makeup and bells, and made to dance at private parties for entertainment.
- **The Exploitation:** After dancing, these boys are routinely subjected to sexual abuse and rape by their owners and guests.
- **A Symbol of Power:** In those power structures, owning a "bacha" was viewed as a ultimate display of wealth, influence, and authority over others.

How the Victims are Sourced

The cold reality is driven by extreme poverty, conflict, and vulnerability:

- **Targeting the Defenseless:** Warlords and police chiefs routinely target orphans, street children, or young boys from impoverished, rural families who have no tribal protection or political leverage to fight back.
- **The "Cash" Reality:** Families are sometimes forced to sell or give up their sons due to massive debts, starvation, or direct coercion under the threat of violence from local commanders.

The Complicity and Geopolitical Silence

For many years, this practice was an open secret that was ignored or actively tolerated due to political convenience:

- **Local Authority Involvement:** During the years of the Western-backed Afghan government, many of the very police chiefs, military commanders, and warlords tasked with security were the primary perpetrators of Bacha Bazi.
- **Foreign Accountability Gaps:** International military forces, including US and NATO troops, frequently turned a blind eye to the practice. Military leaders often instructed troops not to

intervene, fearing that confronting local commanders over the abuse of boys would jeopardize strategic military alliances and intelligence-sharing operations.

Current Status

While the Taliban officially banned the practice of Bacha Bazi upon taking control of Afghanistan, human rights monitors report that child exploitation, forced marriages, and human trafficking remain rampant across the country due to total economic collapse, a complete lack of independent legal oversight, and the systemic oppression of vulnerable youth.
