

Bitcoin Follow-the-Money Trace

Target address: 3EKMtPc89gGsJHaCtcbWykT4zRLH6hTg9X

Scope: UTXOs that existed at any point during 2020-01-01 through 2020-12-31

Generated: 2026-08-18 14:07 UTC

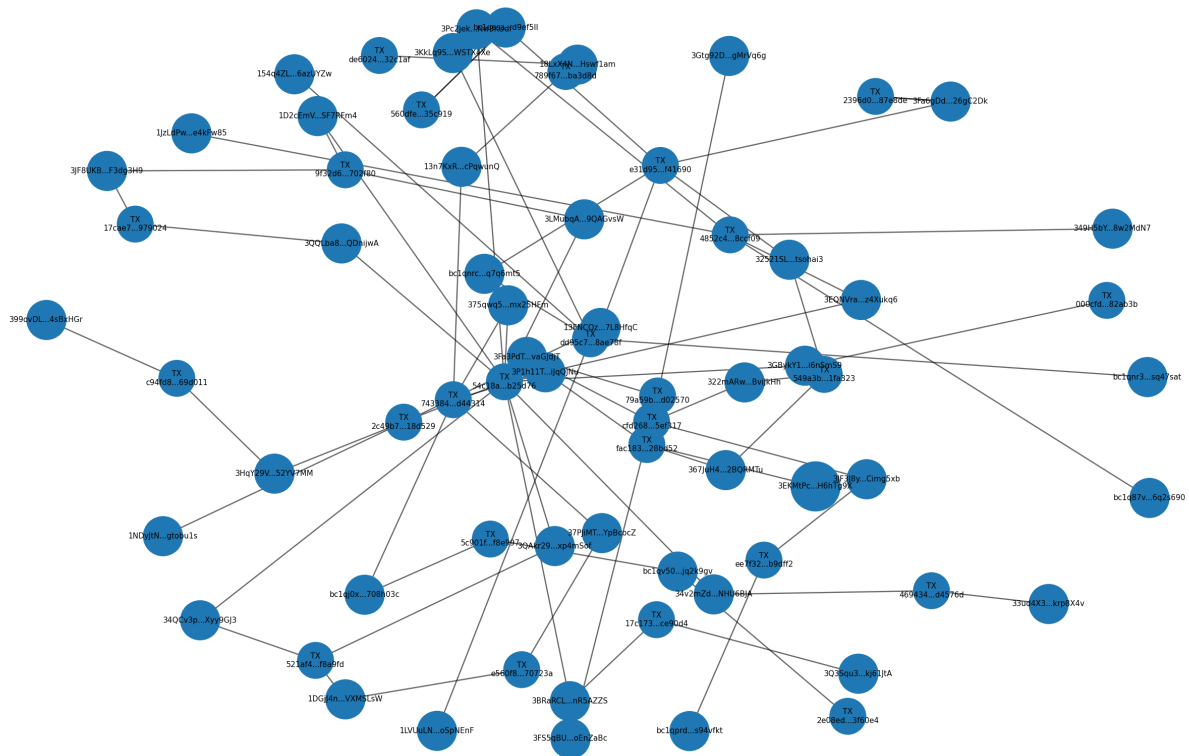

Executive summary

Relevant starting UTXOs: 1. Starting value in those UTXOs: 0.06423410 BTC. Traced transaction nodes: 37. Recorded flow edges: 436. Addresses/scripts encountered: 389.

Interpretation warning: Bitcoin tracks unspent transaction outputs (UTXOs), not tagged coins. Before commingling, an outpoint spend is an exact transaction fact. Once a spending transaction combines tracked and untracked inputs, this report uses proportional attribution only as a visualization heuristic. It is not proof that a specific later output, address, wallet, person, or service received the original coins.

Flow graph

Bitcoin UTXO trace (static view; full graph in GraphML)

Static graph is intentionally capped for readability; trace_graph.graphml contains the full graph.

Starting address profile

Metric	Value
Confirmed current balance	0.0 BTC
Balance incl. mempool	0.0 BTC
Confirmed tx count	2
Address type	P2SH if the supplied address begins with 3 (validated separately in package metadata)

UTXOs present during the requested period

Funding tx	vout	Funded	Value BTC	Spend tx	Spent
d4458486...a8696533	2	2017-12-10	0.06423410	fac1838d...fe28bd52	2020-06-05

Encountered addresses and current balances

Balances below are whole-address balances at retrieval time. They are not the amount attributable to the starting address and do not establish ownership.

Methodology and evidence levels

1. Select outputs paid to the target address that existed at any point during the requested period. 2. Follow each selected outpoint to its exact spending transaction using the Esplora outspend endpoint. 3. If all input value of a downstream transaction is fully tracked, output values remain fully tracked (less the transaction fee). 4. If tracked value is mixed with outside inputs, allocate each output a proportional share equal to tracked input / total input. 5. Stop at unspent outputs, the hop limit, a small-value threshold, or high fan-out transactions.

Evidence levels: 'fully_tracked' means the transaction's input value is completely within the tracked lineage. 'proportional_after_commingling' is a heuristic, not a factual assignment of particular satoshis. Service/wallet identity is not inferred from address reuse or transaction shape alone.

Data sources

Primary chain data: Mempool.space public Esplora-compatible REST API, with raw JSON snapshots saved in the raw/ folder. API base can be replaced with another compatible Esplora endpoint such as Blockstream's public API.

This report deliberately excludes personal identifiers supplied outside the blockchain because they are not needed for the chain analysis.
